The Sun has been an object of scientific interest since the time of the ancient Greeks. The vast amounts of observational data acquired in recent years have led to a greatly improved knowledge of the physics of the Sun. With a minimum of technicalities, this book gives an account of what we now know about the Sun's interior, its surface and atmosphere, its relation to the solar system including the earth, and its relation to other stars. The way that solar power is being converted to useful forms of energy is explained. The book is aimed at anyone with a broad science background interested in learning about the latest developments in solar studies, from those at high-school level to the non-specialist professional. These proceedings of the international conference on advances in site investigation practice held in 1995 provide vital information for all professionals involved in the planning, execution, interpretation and applications of site investigations. It draws together the research and experience of many of the most eminent professional engineers and academics, presenting a substantial body of knowledge. This volume deals with the propagation of three-dimensional shock waves and their reflection from curved walls. It is divided into two parts. The first part presents a ray method. This is based on the expansion of fluid properties in power series at an arbitrary point on the shock front. Continuous fractions are used. Results for shock propagation in non-uniform fluids are given. The second part discusses the shock reflection from a concave body. The important shock-focusing problem is included. The work is supported by both numerical and experimental results. Many interesting features, such as formation of a jet, vortices and the appearance of disturbances on the shock front, are discussed. Besides shock waves in gases, the distinctive features of shock propagation through a weakly ionized plasma are considered. This book presents selected mathematical problems involving the dynamics of a two-dimensional viscous and ideal incompressible fluid on a rotating sphere. In this case, the fluid motion is completely governed by the barotropic vorticity equation (BVE), and the viscosity term in the vorticity equation is taken in its general form, which contains the derivative of real degree of the spherical Laplace operator. This work builds a bridge between basic concepts and concrete outcomes by pursuing a rich combination of theoretical, analytical and numerical approaches, and is recommended for specialists developing mathematical methods for application to problems in physics, hydrodynamics, meteorology and geophysics, as well for upper undergraduate or graduate students in the areas of dynamics of incompressible fluid on a rotating sphere, theory of functions on a sphere, and flow stability. This book gathers invited contributions from active researchers to provide an up-to-date overview of the geological setting of the Red Sea. It discusses aspects ranging from historical information to modern research in the Red Sea, and presents findings from rapidly advancing, emerging fields. This semi-enclosed young ocean basin provides a unique opportunity to study the development of passive continental margins in order to examine the current status of that region. In addition to studies on the Sea itself, it includes those from related fields on the littoral zone. The book is of interest to geoscientists and non-specialists alike. Special relativity is the basis of many fields in modern physics: particle physics, quantum field theory, high-energy astrophysics, etc. This theory is presented here by adopting a four-dimensional point of view from the start. An outstanding feature of the book is that it doesn't restrict itself to inertial frames but considers accelerated and rotating observers. It is thus possible to treat physical effects such as the Thomas precession or the Sagnac effect in a simple yet precise manner. In the final chapters, more advanced topics like tensorial fields in spacetime, exterior calculus and relativistic hydrodynamics are addressed. In the last, brief chapter the author gives a preview of gravity and shows where it becomes incompatible with Minkowsky spacetime. Well illustrated and enriched by many historical notes, this book also presents many applications of special relativity, ranging from particle physics (accelerators, particle collisions, quark-gluon plasma) to astrophysics (relativistic jets, active galactic nuclei), and including practical applications (Sagnac gyrometers, synchrotron radiation, GPS). In addition, the book provides some mathematical developments, such as the detailed analysis of the Lorentz group and its Lie algebra. The book is suitable for students in the third year of a physics degree or on a masters course, as well as researchers and any reader interested in relativity. Thanks to the geometric approach adopted, this book should also be beneficial for the study of general relativity. "A modern presentation of special relativity must put forward its essential structures, before illustrating them using concrete applications to specific dynamical problems. Such is the challenge (so successfully met!) of the beautiful book by Éricourgoulhon." (excerpt from the Foreword by Thibault Damour) *Physical Acoustics: Principles and Methods* reviews the principles and methods of physical acoustics, with emphasis on applications of the thermal and acoustic response to light. Measurements in which a beam of light (or electrons) excites a system are presented, and information is obtained from the resulting thermal or acoustic waves. Comprised of seven chapters, this volume begins with a description of the use of number theory to design phase gratings and arrays with low directivity, followed by a comprehensive account of ultrasonic generation by pulsed lasers in gases, vapors, liquids, and solids. Thermoelastic generation at a free surface is considered, along with the effect of material ablation and the effect of surface modification by a thin liquid coating or constraining solid layer. Subsequent chapters focus on electron-acoustic imaging of solids; the theory of photothermal and photoacoustic effects in condensed matter; the use of photoacoustics to study the vibrational relaxation of molecules; and analytical applications of photoacoustic spectroscopy to condensed phase substances. The final chapter describes imaging with optically generated thermal waves. This book will be of interest to physicists. The present book is the author's third on the subject of vertical seismic profiling (VSP). Ten years have elapsed since the publication of the first book. During this period, VSP has become the principal method of seismic

observations in boreholes and the chief method of experimental studies of seismic waves in the real earth. VSP combines borehole studies in the seismic frequency band, well velocity surveys, proximity or aplanatic surveys, all of which previously existed as separate methods. The high effectiveness of VSP, its great practical value, the express nature and clarity of the results obtained have all contributed towards a very rapid acceptance of the method. In the USSR VSP has been used in an overwhelming majority of areas and is being used increasingly in many foreign countries as well. This has been greatly facilitated by the translation into English and the publication in the U. S. A. by the Society of Exploration Geophysicists of the book *Vertical Seismic Profiling* (Tulsa, Oklahoma, 1974). As the method has become more familiar, it has attracted growing interest outside the USSR. This has been substantiated by the special seminar on VSP (Oklahoma, 1979) which was organized for 22 U. S. companies and universities and presented by the author. The world's foremost experimental physicist uses humor, metaphor, and storytelling to delve into the mysteries of matter, discussing the as-yet-to-be-discovered God particle. The last decade witnessed an increasing interest of mathematicians in problems originated in mathematical physics. As a result of this effort, the scope of traditional mathematical physics changed considerably. New problems especially those connected with quantum physics make use of new ideas and methods. Together with classical and functional analysis, methods from differential geometry and Lie algebras, the theory of group representation, and even topology and algebraic geometry became efficient tools of mathematical physics. On the other hand, the problems tackled in mathematical physics helped to formulate new, purely mathematical, theorems. This important development must obviously influence the contemporary mathematical literature, especially the review articles and monographs. A considerable number of books and articles appeared, reflecting to some extent this trend. In our view, however, an adequate language and appropriate methodology has not been developed yet. Nowadays, the current literature includes either mathematical monographs occasionally using physical terms, or books on theoretical physics focused on the mathematical apparatus. We hold the opinion that the traditional mathematical language of lemmas and theorems is not appropriate for the contemporary writing on mathematical physics. In such literature, in contrast to the standard approaches of theoretical physics, the mathematical ideology must be utmost emphasized and the reference to physical ideas must be supported by appropriate mathematical statements. Of special importance are the results and methods that have been developed in this way for the first time. In the last thirty years think tanks have emerged as major actors on the political stage, comparable in influence to large interest groups, political parties, and government agencies. In the same time span these think tanks have replaced universities as the main source for new policy ideas and the background research and arguments to justify them. Proceedings of Sessions from the First Congress of the International Society for Analysis, Applications and Computing held in Newark, Delaware, June, 2-, 1997 This book presents seven case studies of large Danish investment companies in India and China. The case studies provide intriguing perspectives on the strategic and managerial challenges and opportunities facing Western multinational corporations operating in these two Asian giants. The case studies encourage readers to adopt a decision maker's perspective, targeting students and managers interested in multinational corporation strategy in emerging markets. This volume contains the papers of the 1st Workshop IFToMM for Sustainable Development Goals (I4SDG), held online on November 25-26, 2021. The main topics of the workshop include the aspects of theory, design and practice of mechanism and machine science which are instrumental in reaching a sustainable development, such as: biomechanical engineering, sustainable energy systems, robotics and mechatronics, green tribology, computational kinematics, dynamics of machinery, industrial applications of mechanism design, gearing and transmissions, multibody dynamics rotor dynamics, vibrations, humanitarian engineering, and socio-technical systems for sustainable and inclusive development. The contributions, which were selected by means of a rigorous international peer-review process, highlight numerous exciting ideas that will spur novel research directions and foster multidisciplinary collaboration among different specialists, demonstrating that medical and service robotics will drive the technological and societal change in the coming decades. This book explores the cultural, social, spatial, and political dynamics of skateboarding, drawing on contributions from leading international experts across a range of disciplines, such as sociology and philosophy of sport, architecture, anthropology, ecology, cultural studies, sociology, geography, and other fields. Part I critiques the ethos of skateboarding, its cultures and scenes, global trajectory, and the meanings it holds. Part II critically examines skateboarding in terms of space and sites, and Part III explores shifts that have occurred in skateboarding's history around mainstreaming, commercialization, professionalization, neoliberalization and creative cities. An assessment of the recent unprecedented Taiwanese democratic elections, which, despite threats from Beijing, set the stage for genuine democracy in Taiwan. A firsthand account of three crucial elections in the 1990s, two of which were unprecedented: the 1994 election of the first governor of Taiwan and the 1996 presidential election. The latter marked the first direct election of a chief executive in Taiwan or any Chinese nation in 5,000 years of Chinese history. This study considers the political environment in which these elections were held, particular political issues, party strategies and campaigns, and election results. Taiwan is now in the final stage of democracy, and its impressive political modernization is one proof of its new status. The 1995 legislative election and the 1996 presidential election were held amidst Beijing's intimidation in the form of missile tests close to Taiwan's shores, massive military exercises, and verbal threats. Such posturing forced the United States to send aircraft carriers to the area in response. Taiwan's remarkable progress has begun to draw the attention of the leaders of developing countries who have come to see Taiwan's political modernization as a model for their own nations. A multidisciplinary update on continental plate tectonics and plate boundary discontinuities Understanding the origin and evolution of the continental crust continues to challenge Earth scientists. Lithospheric Discontinuities offers a multidisciplinary review of fine scale layering within the continental lithosphere to aid the interpretation of geologic layers. Once Earth scientists can accurately decipher the history, internal dynamics, and evolution of the continental lithosphere, we will have a clearer understanding of how the crust formed, how plate tectonics began, and how our continents became habitable. Volume highlights: Theories and observations of the current state of tectonic boundaries and

discontinuities Contributions on field observations, laboratory experiments, and geodynamic predictions from leading experts in the field  
Mantle fabrics in response to various mantle deformation processes Insights on fluid distribution using geophysical observations, and thermal and viscosity constraints from dynamic modeling Discontinuities associated with lithosphere and lithosphere-asthenosphere boundary An integrated study of the evolving physical and chemical processes associated with lithosphere asthenosphere interaction Written for academic and research geoscientists, particularly in the field of tectonophysics, geophysicists, geodynamics, seismology, structural geology, environmental geology, and geoenvironmental engineering, Lithospheric Discontinuities is a valuable resource that sheds light on the origin and evolution of plate interaction processes. This book reports thermo-mechanical coupling constitutive equations and impact damage distributions of 3-D braided composite materials under impulsive loadings, in multidisciplinary fields among mechanical engineering, textile engineering and impact dynamics. The 3-D braided composite is one of the unique textile composites with integrated braided preform structure. Currently the 3-D braided composite has been rapidly applied to aerospace, automotive and medical engineering because the materials could realize the integration of material structure to manufacture complex structural parts and reduce the number of assembly connections. This book presents a thermo-mechanical coupled multiscale geometrical model of the 3-D braiding composite beams and tubes for analyzing damage mechanisms under various impact velocities. Impact deformation and damage morphologies have been described both in experimental observations with high speed cameras, micro-CT and finite element analyses. All the impact damages are shown in figures for unveiling the relationships between microstructure and failure modes. This provides a vivid way for how to design braided structures with high impact damage tolerance. The book is intended for graduate students who are interested in composite materials and mechanics, researchers investigating on impact dynamics of composite structure design, and engineers working on impact-proof structure design. The English translation of this book from its Chinese original manuscript was done with the help of artificial intelligence (machine translation by the service provider DeepL.com). A subsequent human revision of the content was done by the author. This book presents three lectures by Allan Hobson, entitled “The William James Lectures on Dream Consciousness”. The three lectures expose the new psychology, the new physiology and the new philosophy that derive from and support the protoconsciousness hypothesis of dreaming. They review in detail many of the studies on sleep and dreaming conducted since the days of Sigmund Freud. Following the lectures are commentaries written by scholars whose expertise covers a wide range of scientific disciplines including, but not limited to, philosophy, psychology, neurology, neuropsychology, cognitive science, biology and animal sciences. The commentaries each answer a specific question in relation to Hobson’s lectures and his premise that dreaming is an altered state of consciousness. Capitalizing on a vast amount of data, the lectures and commentaries provide undisputed evidence that sleep consists of a well-organized sequence of subtly orchestrated brain states that undoubtedly play a crucial function in the maintenance of normal brain functions. These functions include both basic homeostatic processes necessary to keep the organism alive as well as the highest cognitive functions including perception, decision making, learning and consciousness. This is the first book on the subject matter of relativistic nonlinear electrodynamics The book presents new results on various nonlinear electromagnetic phenomena The topics discussed in the book will be the center of fundamental research in the next decade A history of the Czechoslovakian military’s connection to some of the nation’s most innovative and subversive cinema. During the 1968 Prague Spring and the Soviet-led invasion and occupation that followed, Czechoslovakia’s Army Film studio was responsible for some of the most politically subversive and aesthetically innovative films of the period. Although the studio is remembered primarily as a producer of propaganda and training films, some notable New Wave directors began their careers there, making films that considerably enrich the history of that movement. Alice Lovejoy examines the institutional and governmental roots of postwar Czechoslovak cinema and provides evidence that links the Army Film studio to Czechoslovakia’s art cinema. By tracing the studio’s unique institutional dimensions and production culture, Lovejoy explores the ways in which the “military avant-garde” engaged in dialogue with a range of global film practices and cultures. (The print version of the book includes a DVD featuring sixteenth short films produced by the Czechoslovak Ministry of Defense. The additional media files are not available on the eBook.) “Alice Lovejoy’s revelatory study of the cinema culture wrought by the Czechoslovak Army Film studio is a cause for celebration among both cinephiles and media scholars. . . . Lovejoy’s curatorial enterprise brings these fascinating films to us for fresh examination. Seeing these artful army films nearly half a century later opens our eyes to work that requires us to reassess what we thought we knew about documentary, new waves, and world cinema itself.” —Dan Streible, New York University “Lovejoy restores these sometimes funny, sometimes poignant and always innovative films to their proper place in film history, while explaining the unique cultural politics that allowed them to blossom beneath the noses of the Stalinist government.” —Tom Gunning, University of Chicago “Filled with surprises for readers who thought they knew their Czech film history, this insightful book refutes many received ideas about Eastern European cultural politics during the Cold War and sketches a complex and nuanced relationship between artists and the socialist state.” —Rick Prelinger, UC Santa Cruz International business correspondence is not simply writing or information exchange. It is something that you want others to know about you – to know about your business and the way you deal with business transactions. For the last several years, the study of interfacial instability and pattern formation phenomena has preoccupied many researchers in the broad area of nonlinear science. These phenomena occur in a variety of dynamical systems far from equilibrium. In many practically very important physical systems some fascinating patterns are always displayed at the interface between solid and liquid or between two liquids. Two prototypes of these phenomena are dendrite growth in solidification and viscous fingering in a Hele-Shaw cell. These two phenomena occur in completely different scientific fields, but both are described by similar nonlinear free boundary problems of partial differential-equation systems; the boundary conditions on the interface for both cases contain a curvature operator involving the surface tension, which is nonlinear. Moreover, both cases raise the same challenging theoretical issues, interfacial instability mechanisms and pattern selection, and it is now found that these issues can be solved by the same analytical approach. Thus, these

two phenomena are regarded as special examples of a class of nonlinear pattern formation phenomena in nature, and they are the prominent topics of the new interdisciplinary field of nonlinear science. This research monograph is based on a series of lectures I have given at McGill University, Canada (1993-1994), Northwestern Poly technical Institute, China (1994), Aachen University, Germany (1994), and the CRM summer school at Banff, Alberta, Canada (1995).
