It has become highly desirable to provide users with flexible ways to query/search information over databases as simple as keyword search like Google search. This book surveys the recent developments on keyword search over databases, and focuses on finding structural

information among objects in a database using a set of keywords. Such structural information to be returned can be either trees or subgraphs representing how the objects, that contain the required keywords, are interconnected in a relational database or in an XML database. The structural keyword search is completely different from finding documents that contain all the user-given keywords. The former focuses on the interconnected object structures, whereas the latter focuses on the object content. The book is organized as follows. In Chapter 1, we highlight the main research issues on the structural keyword search in different contexts. In Chapter 2, we focus on supporting structural keyword search in a relational database management system using the SQL query language. We concentrate on how to generate a set of SQL queries that can find all the structural information among records in a relational database completely, and how to evaluate the generated set of SQL queries efficiently. In

Chapter 3, we discuss graph algorithms for structural keyword search by treating an entire relational database as a large data graph. In Chapter 4, we discuss structural keyword search in a large tree-structured XML database. In Chapter 5, we highlight several interesting research issues regarding keyword search on databases. The book can be used as either an extended survey for people who are interested in the structural keyword search or a reference book for a postgraduate course on the related topics. - Use opponents' objections as the springboard for deeper and broader cross-examinations.
- Sequence cross-examination to teach the theory of the case in the best way, and to literally expand the rules of admissibility.
- Use "loops" (the practice of incorporating and repeating key phrases and terms in successive questions to the witness) to rename witnesses and exhibits.
- Use "double loops" to discredit opposing expert witnesses.
- Use voir dire to create great jurors
- Use a fact-driven investigation to develop a winning theory
- Use a witness's own words to follow your theme and

theory • Control the runaway witness • Communicate winning theories in opening, cross, and closing • Use loops to box in the witness • Use tactical sequencing to create the most powerful cross • Convert a witness's silence into admission of fact • Induce the witness to voice your pre-selected words • Prepare for devastating impeachment • Close off any escape routes for the witness • Punish the evasive or "I don't know" witness • Control the crying witness • Use timing, posture, inflection, diction, wording, eye contact, and other effects to emphasize a witness's concession Effective cross-examination is a science with established guidelines, identifiable techniques, and definable methods.
